

Lecture Homework Week 06 - Tuesday

Name: Jade Than

NetID: athan016

Responses:

Problem 1:

For part 1, below answer why the program does not work when you comment out the line `BL copy_vector`

`BL copy_vector` copies the vector table to be at address 0, which is where the vector containing all the addresses to the exceptions is expected to be. By removing this line, the vector does not exist at address 0 and all calls to interrupts give reference errors.

For part 2, below answer why moving the vector table to the beginning of the `start.s` file works after recompiling

Moving the vector table to the beginning of the file does not actually work because it is not moved to address 0 but instead the address 0x10000.
